Proposed solution:

Our project is to create an attractive website using canva which is simple and user friendly process that involves no coding or designing process. This system allows restaurant to quickly and easily manage online menus and customers can navigate and place orders really fast. Restaurant staff also quickly view orders and prepare orders without previous miscommunication. Graphical interfaces are really efficient and effective for both customers and restaurant staff. Any web browser such as Edge, Chrome, and Firefox can be used to access the website in any environment such as windows or Linux. For this, we have made a solution by creating a website for a restaurant. This process of creating a website looks simple as the website is created by just editing the contents in the default template. In this website various details has been included like

- Name of the restaurant
- Menu contents
- Address of the restaurant
- Images of the dishes
- Contact details of the restaurant
- History of the restaurant

The above mentioned details are exclusively included in the website that is created using canva. Additionally the restaurant location and the availability can also be displayed through this website and customers can view the menu and could pre-order the dish through the website so that at the time of their arrival, their food will be ready and time could be saved. This will help to run their operations smoothly and in more efficient manner.
